

# NOAH

The NOAH enclosures are designed with a variety of very effective damping materials. The isolation capability of this new developed enclosure against acoustic noise begins with 30 dB in the range between 88-177 Hz, continuously increasing to considerable 41 dB in the range between 1414-2828 Hz. The NOAH series noise canceling and electro-magnetic shielding performance will ideally be completed by an active vibration isolation table of the TS series - to stop ambient mechanical vibration.
